Pinochle cheat sheet for beginners printable

You want to study HTML, don't you? By properly cheating a sheet will make your life a ton of easier. When I started with web development (back in 2004), I also had a cheat sheet. It's all in my head now. Whether you're a smart web developer or just trying to experiment a little, feel free to use this HTML cheat sheet below. Initially I did it for myself, but since the launch of HTML5, I decided to update it, look better and share it on my website. I listed all the main HTML tags as well as the new HTML5 tags. Enjoy! If you want to download .pdf, click here (237kb) - This version is based on HTML Cheat Sheet in , PNG Alternative HTML Cheat Sheet in .pdf, optimal for tabloid-sized paper (11x17in) print, click here (138kb) to download If you want to use this as an image, click here (3508 x 2717) 1. They are in html cheat Sheet in .pdf 2. HTML Canvas Cheat Sheet in .pdf If you want to download this as .pdf, use this link (right click, Save link as). 3. HTML Cheat sheet in .png If you want to download this as .png, open this link and save the image. You can also download the image below directly (right-click>Save image) Serious rival to Adobe Flash? Or just a flash in the pan? HTML5, is this the newest nerd? I just learned what LMAO means... No, HTML5 is a new specification for HyperText Markup Language, the software code that is used to create web pages. This is a new set of standards that will make it easier for web browsers to run video and online applications. I can do all this today, why does that matter? Today, most web pages are written in software language, meaning web browsers can't support streaming video or web apps like Google Maps or Gmail. One common way to do this is for browsers to use software add-ons, software that works in the browser that can stream video or audio or support interactive web applications. The most famous examples are the Adobe Flash add-on used on YouTube for streaming video and Microsoft's Silverlight. HTML5 takes away the need for a web browser to use add-ons for its own software by adding tags that allow browsers to support video or audio playback or advanced web application features, such as allowing them to work offline. Other features supported by HTML5 include Web sockets to push out browser updates, web workers to allow web applications to perform multiple tasks at once, and to support more interactive 2D graphics. Examples of the type of applications that HTML5 will allow to run from the natural browser include online purchasing systems, search systems, games, public phone or address books, communication software, and document editing software. How widely Google Chrome, Mozilla Firefox, Opera and Apple Safari support the HTML5 specification, but there is no native support for it in the most commonly used web browser, Microsoft Internet Explorer. Most websites websites to use HTML5 currently as an HTML5 specification, the agreed definitions for the new labels is only at the design stage. This means developers are wary of creating sites based on a specification that is subject to change, although some tags, such as those that support streaming video or audio, are relatively fixed. One of HTML5's biggest supporters so far is Google, which offers the ability to stream HTML5 videos on YouTube. The Searcher recently announced that it will cut from its own Google Gears software, which allows access to its web apps offline to use HTML5. Google has said you will run your Google Gears software in the future and use HTML5 instead (Screenshot: Google) What are the advantages? Currently, the HTML5 project specification cannot offer any new features for web applications that cannot be achieved with flash or Silverlight plugin. One advantage that has been reported is a boost in video streaming efficiency, some people who use HTML5 video streaming say it's much less taxation of their computer's PROCESSOR, allowing video to be streamed on less powerful machines. Where will it have the greatest impact? HTML5 is expected to make the biggest difference for mobile phones... If you're just starting to use Google Sheets, its advanced features and add-ons can be a little overwhelming. Here are some tips to get you to use this powerful, free alternative to Microsoft Excel. What is Google Sheets? If you've heard of Google Sheets before, feel free to jump ahead. If you haven't heard of it, here's a course on the crash. We'll look at the basics and get you to work out what Google Sheets is and how you can get started right away. Google Sheets is a free web-based spreadsheet program offered by Google as part of the overall office suite — Google Drive — to compete with Microsoft Office. Other basic services included in the cloud package are Docs (Word) and Slides (Powerpoint). RELATED: Google Docs Beginner's Guide Google Sheets is available on all devices and platforms; all you need is an Internet connection and a web browser (or, in the case of mobile devices, applicable apps). Google does the rest and handles the burden of heavy lifting while running the software in the cloud. Sheets support several different file types, including XLS, XLSX, XLSM, TXT, ODS, and CSV, making it easy to view and convert Microsoft Office files directly from Google Drive. And since Sheets is an online spreadsheet program, you can share and collaborate with multiple people in a single document, tracking corrections, changes, and suggestions in real time. Have you heard enough? Let's get started. How to sign up for an account something you need to do before you can use Google Sheets is sign up for a Google Account (@gmail account). If you already have an account, feel free to go to the next section. If not, we'll go see an easy way to create a Google Account and set up with Tables. Go to accounts.google.com, click Create account, and then click About me. On the next page, you'll need to provide information to create an account, such as first and last name, username, and password. You also need to verify your phone number to make sure you're a real person, not a bot. Once you have confirmed your phone number, the following pages require you to provide a recovery email address, date of birth and gender, as well as agree to the privacy statement and terms of use. Finish this and you're the proud new Google Account owner. How to create a blank spreadsheet Now that you have a Google Account, it's time to create your first spreadsheet. Go to Google Sheets and place your cursor on the multicolored + icon in the lower-right corner. + turns into a green pencil icon; click on it. You can also type sheets.new in the address bar and press Enter to automatically create and open a new blank spreadsheet in the current section. How to import a Microsoft Excel spreadsheet, even if you're all new to Google Sheets, you may already have stocks of Microsoft Excel files that you want to be able to use. If this is the case, then all you need to do is upload all your documents to Excel, and Google does the rest. While it may not support some of the more advanced features and effects of some Excel tables, it works pretty well and always adds more features. When you import an Excel document, you can use Google Sheets or Drive to upload your files. Both methods allow you to drag and drop a file from your computer directly into the web browser for easy upload. Your device contains all your uploaded files, but for convenience, when you head to sheets homepage, it only shows you spreadsheet files. From the Google Sheets home page, click the folder icon at the top right, click the Upload tab, and then drag an Excel file from your computer. After the Excel file is uploaded, Sheets automatically converts and opens it, ready to start editing, sharing, and collaborating. To open an Excel file that you want to edit that has already been uploaded, click the green X file next to the file name from the Google Sheets home page. Click either the Excel file or edit it in Sheets from the dialog box that appears. When you finish the document, you can download it as XLSX or ODS, PDF, HTML, CSV, or TSV format. Click File > Download Then click on the desired format and you will download it directly where the files are saved from your browser. RELATED: How to import an Excel document into Google Sheets How to collaborate with documents One of the Features of Google Sheets is the ability to generate a shared link that allows anyone with google sheets to view, comment on, or edit your document. Instead of sending files between contributors, you can make all edits and suggestions, suggestions, suggestions, you have all been curled up through the same computer in real time. The only difference is that each person has their own cursor to enter text to use on their PC. From the document you want to share, click the green Share button to choose how and with whom you want to send a link to your file. You can enter email addresses manually or click get shareable link in the top corner to submit the invitation yourself. From the drop-down menu, you can edit how much power shared users have on the file when you select one of the following options: Off: Sharing is disabled. If you've previously shared a relationship with others, it will no longer work and I'll revoke permissions they've had before. Anyone with a link can edit: Gives shared users full read/write access. They still can't delete it from your disk, even though it's only for the contents of the file. Anyone with a link can comment: Allows shared users to leave comments if they want — this is great for team projects. Anyone with a link can see: Shared users can view the file, but they can't edit it in any way. This is the default action when you share a file, and the best option if you're trying to share a download. You can do much more with these connectors that can be shared, which also work with other drive files and on mobile devices. For a deeper look at how these links work and how to generate them, check out our post. However, sometimes, you want to preserve the integrity of certain cells and stop anyone trying to change them. So if you've shared a spreadsheet with a group of people but want to prevent them from editing specific cells in the file, you might want to cancel their access to them. Highlight all cells you want to protect, and then click Data > Protect Sheets & Ranges from the toolbar. The Protected Sheets and Ranges pane appears on the right. Here you can enter a brief description, and then click Set Permissions to customize cell security permissions. By default, anyone who already has permission to edit the document has the right to edit any cell on the page. Click the drop-down menu under Restrict who can edit this range, and then click Custom to specify who has the right to edit the selected cells. Under the list of people who can edit, anyone with whom you have shared edit permissions has already been selected by default. Uncheck anyone who doesn't want to be able to edit the selected cells, and then click Finish. Every time someone tries to change or edit the cells you have just protected, they see a prompt informing them that Want to display a warning only before someone edits cells, or maybe protect the entire spreadsheet? See our post for more information. RELATED: How to protect cells from editing in Google Sheets How to see Recent changes to a document When you share documents with others, it's hard to keep track of any small changes that happen if you're not available. That's why there's a history of revision. Google Sheets monitors all changes that occur in the document and groups them in periods while preserving the cluttered build-up. You can even return a file to any of the previous versions listed in history with a mouse click. You can view a list of all recent changes by clicking Version History > > See Version History. Changes made by each team member are different colors, making it easier to track who did what you weren't looking for. RELATED: How do I see recent changes to Google Docs, Tables, or Presentations File How to use Google Sheets offline What happens if you need to access Google Sheets but don't have an Internet connection? Although Sheets is a Web-based product, that doesn't mean you can't use it offline. You need to download a Chrome extension in advance and make sure that you have previously enabled the file for offline use. Any changes you make to the file update the next time you connect to the Internet. Once you're downloading the official Chrome extension, go to the Google Sheets homepage and in the upper-left corner, click the Hamburger menu > Settings. Once you're here, switch Offline to on position, then click OK. To save storage on your local computer, Google downloads and makes the most recently available files available offline. To enable the file manually, click the three-point icon, and then turn on Offline on On. RELATED: How to use Google Docs Offline Translates words directly into Google Sheets You need to translate words or phrases from one language to another without leaving the page? Well, there's a special formula you can use to fly single words — or even a batch of them — directly into Google Sheets cells. The formula looks like this: =GOOGLETRANSLATE(text, source language, target language) When you want to translate text into your document, you can either type the words to translate directly into the formula, or type in the cell containing the word/phrase to translate. Here we refer to the text in cell A2, specify the input language as English (en), and output as Chinese (zh), then press Enter and watch it do your thing. If you have a list of words in one column, all you need to do is select the cell which contains the formula, and then drag the blue square to the desired row. If you've ever used Google Translate before, you know it's not exactly 100% of the time, but it works well as a reliable solution for common words and phrases. RELATED: How to use Google Translate directly in Google Sheets Automate tedious Tasks using Google Sheets Automate recurring tasks with a specific sequence of instructions to increase productivity in your spreadsheets. When you click Save, sheets create a script with all the code to replicate annoying and monotonous steps. When you record a macro in the Sheets, it automatically creates a script for applications with all the code to replicate your actions for you. This means that you can create complex macros without knowing how to write code. The next time you run it, Sheets will do everything you did when you saved the macro. Essentially, you teach Google Sheets how to manipulate a document according to your wishes with one command. RELATED: How to load your Google apps with the Script Editor Here are a few examples of its powerful functionality: Apply formatting and styles. Create completely new spreadsheets. Use any google sheets feature, toolbar, menu, or feature. The sky is the limit. To get started, bend a sheet in Google and click Tools > Macros > Macro Record. This opens the record menu at the bottom of the window with two options for capturing your actions: Absolute references: The macro will perform tasks only on the exact cells you save. If you have yalicalize cell B1, the macro will only be catalyzed to B1, regardless of which cell you clicked. Relative references: The macro will perform tasks on the selected cells, regardless of where they are in the sheet. If you have yalicalize B1 and C1, you can reuse the same macro to later fyte cells D1 and E1. Choose whether you want an absolute or relative reference, and then you can start clicking, formatting, and teaching the sheets what order you want them to play. Now you can start moving cells, applying formats, creating functions, etc. Enter a name for your macro. Google also allows you to create shortcuts for up to ten macros. If you want to link a macro to a keyboard shortcut, type a number from 0 to 9 in the space provided. When you are finished, click Save. If you need to tweak the macro name or shortcut, you can edit a macro by clicking Tools > Macros > Manage Macros. From the window that opens, tweak as desired, and then click Update. The next time you click the shortcut associated with the macro, it will run without having to open the macro menu on the toolbar. If your macro is an absolute reference, you can run the macro by pressing the keyboard shortcut or going to Tools > Macros > Macros > Your Macro, and then clicking the appropriate option. Otherwise, if your macro is a relative reference, highlight the cells in the spreadsheet you want the macro to run on, and then tap or click the macro from Tools > Macros > Your Macro. While this should make you start, we have a deeper dive into the use of macros in Tables if you want more information. RELATED: How to automate Google Macro Tables Remove Duplicates You need to remove a bunch of duplicate records in your spreadsheet? This is not a problem with the built-in feature of Google Sheets, which does just that. Easily remove duplicate values from your spreadsheet without having to write a script or manually do it yourself. Highlight the table/cells which contain duplicates that you want to remove, and then click Data > Remove Duplicates. If it the the data has a header order, be sure to check the check box Data have header row, and then click Remove Duplicates. The best add-ons in Google Sheets Now, having learned all the basics of Google Sheets, you can become a real energy user with the addition of add-ons. Add-ons very much like web browser extensions, but are specific to Google Sheets and allow you to get additional features from third-party developers. You can install tools to automatically find facts and calculate formulas, distribute documents to students, generate business reports, and even send emails directly from a document. If you're looking for some of the best supplements to get started, we offer you. RELATED: The best add-ons in Google Sheets
